

Enhancements

Guide

CONTRAST WARNING: This text does not have a high enough contrast ratio against the background for your site's colors. The ratio is 3.75 and most text needs to be 4.5 or higher.

■ #808000 - 3.75 - **Current color**

■ #727200 - 4.55 - **Suggested color**

[Highlight](#) [Help](#) [Use suggested](#) [Whitelist](#)

Color Contrast tests have been improved to not only show the existing color ratio but show you the exact color that would work well. In addition there is now a “Use Suggested” button which will allow you to change the text instantly and correct the contrast ratio.

INVALID HEADER: There is an empty heading detected. Headings without any visible content are still visible to screen readers so it should be removed to avoid confusion.

[Highlight](#) [Help](#) [Fix](#) [Whitelist](#)

Header tests now show empty headers and allow you to simply fix them by hitting the “Fix” link, removing the invisible header from the page.

Numerous other heading tests have been improved to detect the issue better and to allow you to see where the header problem is while editing the block itself. There are now tests that will show when page titles are not unique across your site, which will improve both your accessibility and your SEO. There is also a Save and Rescan button now while editing so you can see the effect of your changes without leaving the block that you are working on.

RTE

The RTE has been enhanced with a new color picker tool that will allow you to use any color you choose for text. You can now pick with a color wheel or input the RGB or Hex code for a color to use the exact color you'd like

FEED Blocks on Web Pages now have an archive view

All feed blocks will have a system generated page now that allows the user to see more feed posts. Users will be able to go back and see old news and announcement posts from any public feed block. Previously feed blocks could hold up to 20 posts but there was no function to see any posts that were older.

Fixes

Video Blocks

A recent Chrome update is not compatible with the way that many websites use style sheets and this has resulted in video blocks not displaying properly on certain themes. We have changed the way that video blocks display content and this is resolved.

In addition, various fixes and improvements have also been released.
